Weekly Report

Dean Reiter

May 26, 2026

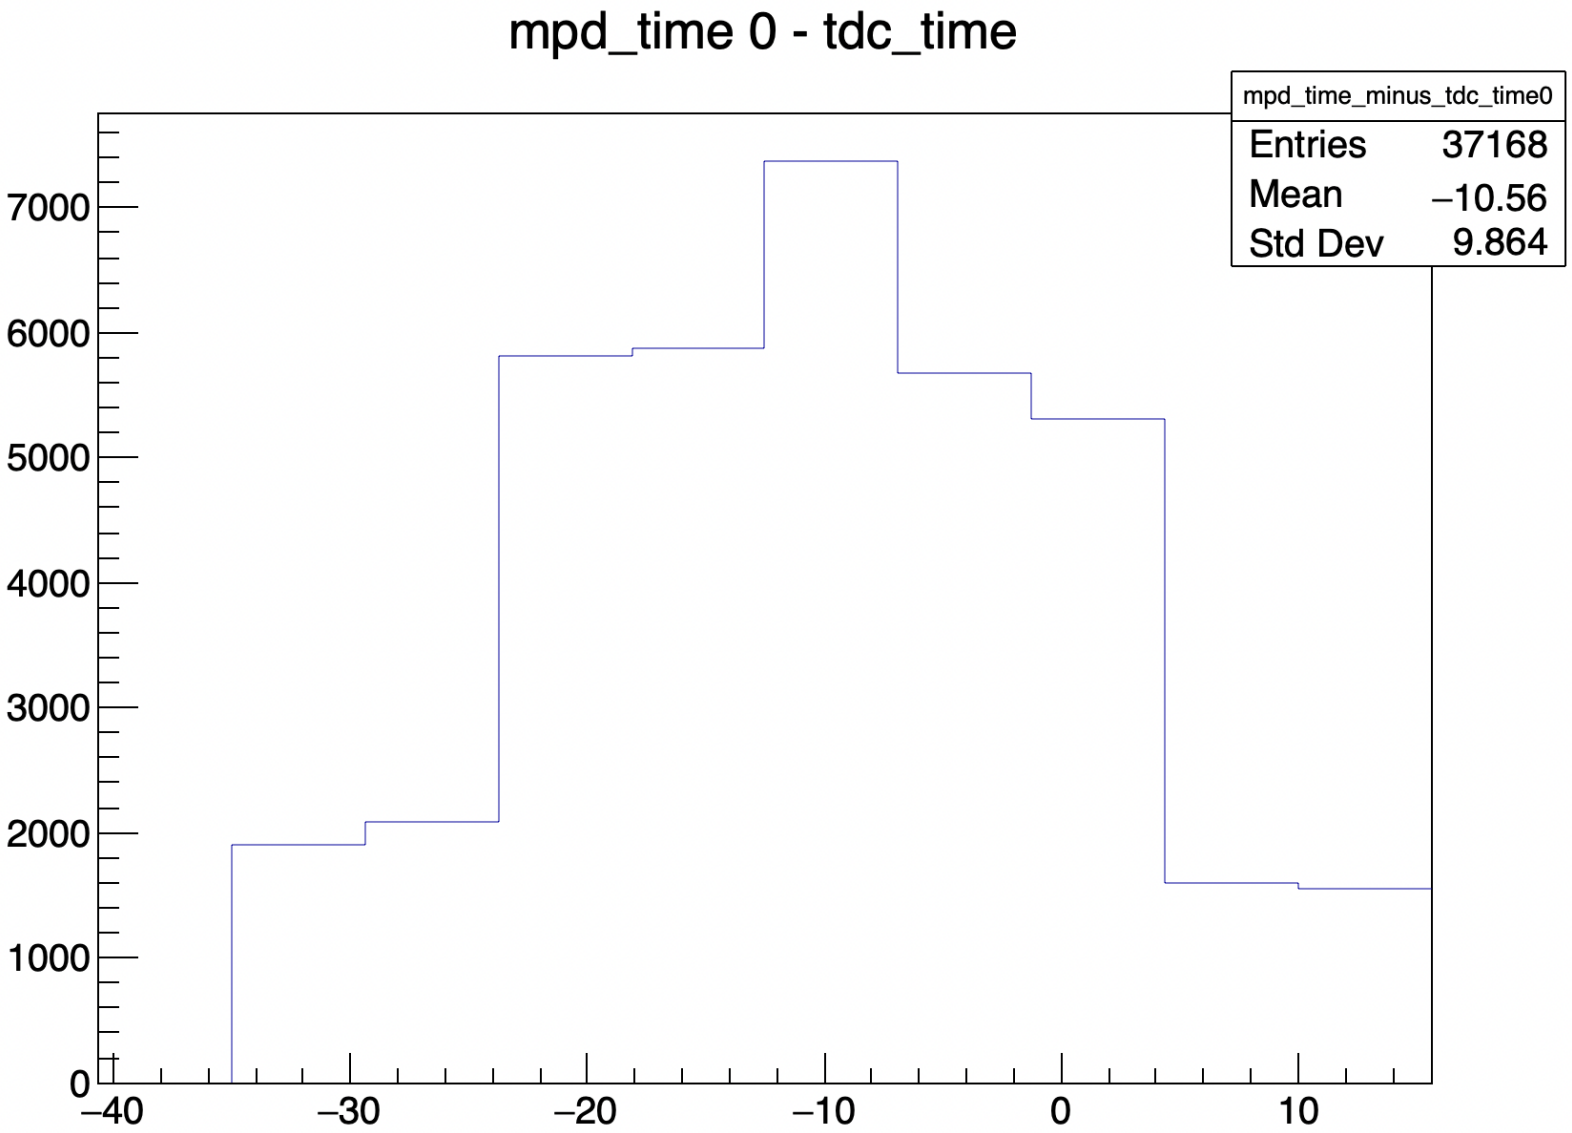

Recap

- Short-term Goal:
  - Correlate timing of clusters and triggers to improve track selection.

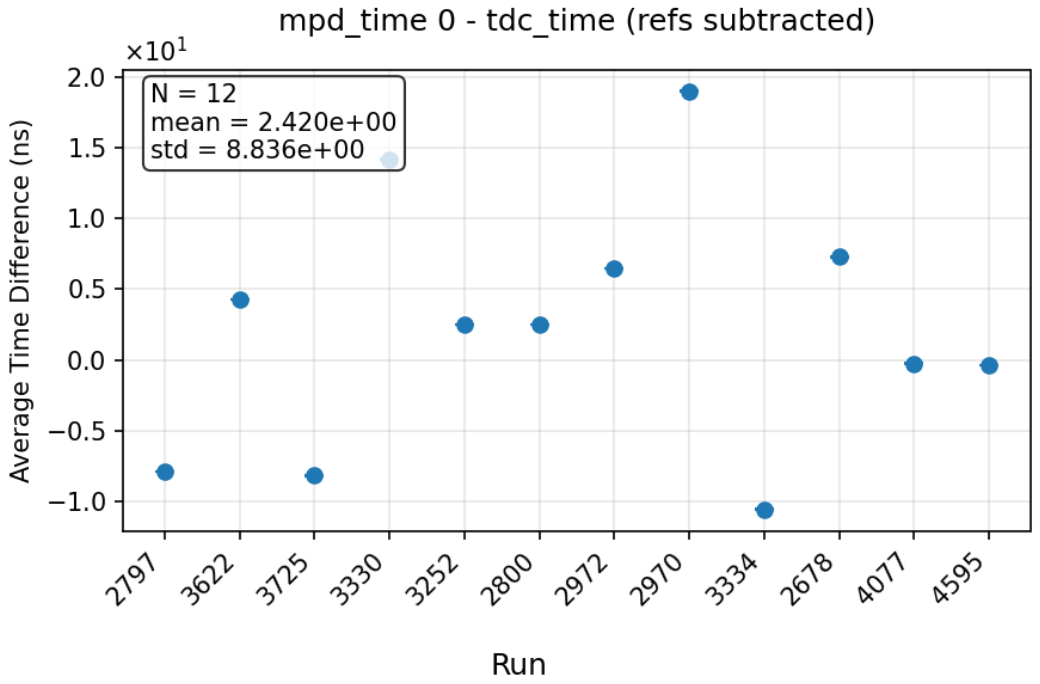

- How?
  - Determine “time” of clusters as sampling period with “peak” ADC values
  - Determine time difference between triggers and clusters in cosmic runs
  - Try using this time difference to select between multiple tracks

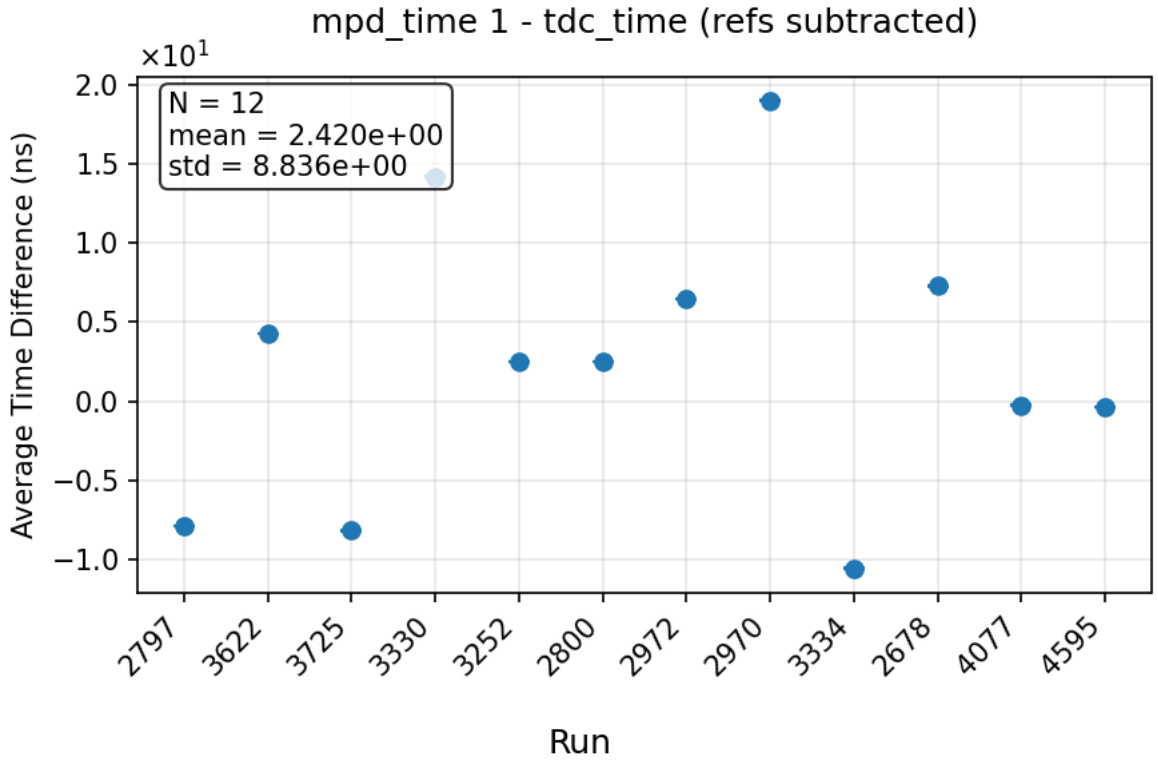

- Preliminary questions:
  - What is the time delay between the GEM and trigger readouts?
  - Is it constant across events?
  - Is it constant across runs?

Run 2797 (100k events)

Multiple runs
