

New trigger tree

1

- ▶ See [include/ScintOutTree.h](#) for details of new output tree structure
- ▶ If your plugin uses the trigger output tree, it is currently disabled in CMakeList. You will need to update your code and re-enable the compilation.

```
class ScintTDC : public DLRTBase
{
public:
    int ch_id;    // SiPM/Logic id. for Hits: 0 - 7 for left, 8 - 15 for right. for Logic: 0, 1, 2 for A, B, T logic
    double tdc;   // raw TDC value
    double tot;   // time over threshold

    ScintTDC();
    virtual ~ScintTDC();

    ClassDef(ScintTDC,1);
};

class ScintHit : public DLRTBase
{
public:
    int ch_id;    // Paddle id
    double pos;
    double poserr;
    double meantime;
    double difftime;
    int tdc_index[2]; // index of the TDC hit in the TDC vector for each side, 0 for left, 1 for right

    ScintHit();
    virtual ~ScintHit();

    ClassDef(ScintHit,1);
};
```

New trigger tree

2

- ▶ See [include/ScintOutTree.h](#) for details of new output tree structure
- ▶ If your plugin uses the trigger output tree, it is currently disabled in CMakeList. You will need to update your code and re-enable the compilation.

```
class ScintHits : public DLRTBase
{
public:
    std::vector<ScintTDC> tdc;
    std::vector<ScintHit> hits;

    void clear();

    ScintHits();
    virtual ~ScintHits();

    ClassDef(ScintHits,1);
};

class ScintTriggers : public DLRTBase
{
public:
    std::vector<ScintTDC> logic[3]; // 0 for A, 1 for B, 2 for T

    void clear();

    ScintTriggers();
    virtual ~ScintTriggers();

    ClassDef(ScintTriggers,1);
};
```
